

Official Product Overview

A baseball operations and player-development command system that connects official stats, practice planning, lifting, soreness, video, classes, staff workflows, and CoachHelm intelligence into one source-aware platform.

Core idea

BaseballHelm is not another stats page. It is the layer that turns official files, tool exports, practice plans, lift data, and video into decisions, assignments, and measurable development.

Stats Integration + Parsing Engine

Zero-touch after setup. Official files first.

AutoSync makes BaseballHelm a downstream destination for official stat files. A program connects once with its SID/stat workflow, then final game files can arrive by SFTP/FTP, HTTPS upload, post-game email, or a small local sync agent. BaseballHelm stores the raw file, detects the provider, parses it, validates totals, matches players, scores confidence, commits trusted stats, and generates a postgame report.

Parsing Engine Highlights

- GameChanger college XML and season CSV pathways
- Presto, StatCrew, SIDEARM/NCAA, StatBroadcast-ready adapters
- Raw file storage, duplicate detection, correction diffs
- Confidence-based auto-commit and review queue
- Official games, scrimmages, practices, and development stats kept separate

Team Management + Practice OS

The cool coach workflow: plan, assign, scrimmage, measure.

BaseballHelm gives coaches a daily operating layer: calendar, games, travel, documents, announcements, acknowledgements, tasks, staff ownership, and player availability. The standout feature is the practice builder: time slots on the left, a required headline for what is being practiced, optional descriptions, assigned staff, assigned players, stations, linked CoachHelm signals, and calendar publishing.

Practice Plan Builder

Time slots on the left. Headline is required. Description, players, staff, signals, and metrics are optional but powerful.

Time-Blocked Plan

2:45

Dynamic warmup + throwing ramp
Pitchers follow workload-specific throwing plan.

workload linked

3:00

Two-strike chase station
Group A sees breaking balls below zone; track swing/take decisions.

CoachHelm signal

3:20

Catcher block down/arm-side
Catchers rotate with machine; tag miss location and recovery.

3:45

Controlled scrimmage
Blue vs White; score as scrimmage; link to practice event.

lineup attached

Scrimmage Lineup

Batting Order

1. Reyes - SS
2. Miller - CF
3. Jackson - 1B
4. Ortiz - DH

Practice Builder	Scrimmage Lineups	Calendar Attachment
• Drag/reorder time blocks • Headline + optional description • Attach staff, player groups, signals, video, and metrics	• Drag players into P, C, 1B, 2B, SS, 3B, OF, DH • Build batting order and planned substitutions • Store scrimmage stats separately from official stats	• Practice plans attach to calendar events • Players see only their assignments • Staff see the full plan, notes, and recap

Lifting + Performance

Built for baseball now. Architected for future sports.

The lifting system is not just a card on the dashboard. It gives strength staff a workflow: preset lifts, lift groups, assignments, results, bodyweight tracking, weights used over time, soreness check-ins, readiness, missed/modified reasons, and baseball-specific context for pitchers, catchers, and two-way players.

Performance Dashboard

- Today's lift groups and completion status
- Bodyweight and exercise load trends
- Soreness heatmaps and readiness flags
- Suggested progression from last used weights
- Pitcher/catcher/two-way workload warnings

Preset Lift Library	Player Lift UX	Multi-Sport Core
• In-season maintenance • Pitcher post-outing recovery • Pre-start primer, catcher recovery, speed/agility	• Today's lift in Player Today • Track reps, load, RPE, soreness • See bodyweight and personal best trends	• Generic performance tables • Baseball-specific workload overlays • Future-ready for other sports

Player Profiles + Onboarding

Everything organized, role-safe, and easy to understand.

Player Snapshot	Assistant Accounts	Player Today
• Official stats, scrimmage stats, practice metrics • Lift history, bodyweight, soreness, classes • Video, tasks, timeline, CoachHelm signals	• Pitching, hitting, strength, ops, academics, scorekeeper, video • Role-specific permissions and onboarding checklists • Position group ownership	• Schedule, lift, check-in, class conflicts • Approved video and assigned tasks • Simple mobile action view

CoachHelm is the analysis layer. It looks at official games, scrimmages, practices, pitch/swing data, lifts, soreness, classes, video, and staff actions. Then it creates source-cited baseball signals, suggests what to do, and tracks whether the action worked. The important part: it is honest about sample size and confidence.

Baseball Signals	Practice Effectiveness	Action Conversion
• Two-strike chase spikes • Game vs practice contact gaps • Pitcher velocity/command decay • Catcher blocking, defensive, baserunning, workload flags	• Connect practice focus to later outcomes • Measure improvement in practice, scrimmage, and games • Call out insufficient sample instead of faking certainty	• Insight to practice block • Insight to player task • Insight to video request, lift modification, or meeting topic
Staff Meeting Mode	Video Evidence	Postgame Reports
• Auto agenda from signals, imports, video queue, tasks, and availability • Every meeting item becomes follow-up • Outcomes tracked later	• Clips tied to pitches, swings, lifts, and practice blocks • Coach annotations become tasks • Source drawers show why an insight exists	• Auto-generated after trusted stat commit • Trend alerts, workload flags, talking points • Practice recommendations for next session

Why it is
different

Teamworks runs broad operations. TeamBuildr runs lifts. GameChanger and StatCrew handle stats. TrackMan, Rapsodo, Synergy, and 6-4-3 create data. BaseballHelm turns all of it into one baseball-specific operating system: source -> signal -> action -> outcome.
