

BaseballHelm

Official Product Overview

A baseball-specific operating system for college, high school, JUCO, and showcase programs. It connects official stats, practice planning, player development, strength, classes, video, staff operations, and CoachHelm intelligence into one source-aware workflow.

The Big Idea

Baseball programs already have data. The hard part is turning that data into organized staff decisions and player execution. BaseballHelm is the layer that receives official files, normalizes messy tool exports, finds what matters, builds practice around it, and measures whether the work is actually improving performance.

AutoSync is the flex: connect once with the SID/stat crew, then postgame stats can update automatically through official XML/game files, SFTP/HTTPS, email attachments, or a local sync agent.

Advanced Feature Highlights

Straight to the point: these are the product systems that make BaseballHelm feel like serious software.

AutoSync Stats

Zero-touch after setup

- Official XML, SFTP/HTTPS, email inbox, local sync agent
- Confidence scoring, correction diffs, postgame AI report

Import Dossier

Every file becomes auditable

- Tool-specific parsers for GameChanger, StatCrew, Presto, TrackMan, Rapsodo
- Preview, validate, match players, commit, rollback

Coach Command Center

The daily cockpit

- What changed, who needs attention, what to do next
- Signals, imports, availability, practice, video, tasks

Signal Inbox

Notifications with teeth

- Every signal has source, confidence, owner, and action
- Convert to task, practice block, video request, or meeting item

Practice Builder

Time-blocked coaching workflow

- Left-side time slots, headline, optional description
- Publish to calendar and show players only their assignments

Scrimmage Lineups

Drag/drop baseball brain

- Field positions labeled: P, C, 1B, 2B, SS, 3B, OF, DH
- Separate scrimmage stats from official game stats

Advanced Feature Highlights

Practice Effectiveness

Measure if development works

- Compare practice focus against scrimmage and game movement
- CoachHelm says improvement, no transfer, or insufficient sample

Player Profile Snapshot

Everything organized

- Stats, video, lift history, soreness, classes, tasks, timeline
- A real player-development operating record

Player Today

Simple mobile execution

- Schedule, lift, check-in, class conflicts, video, tasks
- No staff clutter, just what the player needs to do

Assistant Coach Accounts

Role-specific staff power

- Pitching, hitting, strength, ops, academics, scorekeeper, video
- Permission presets and onboarding checklists

Lifting Dashboard

Performance meets baseball context

- Preset lifts, bodyweight, weights used, soreness, readiness
- Pitcher, catcher, and two-way workload flags

Multi-Sport Performance Core

Future-proof strength OS

- Generic performance tables with baseball-specific overlays
- Eventually expands to other sports without rebuilding

Advanced Feature Highlights

Video Evidence Layer	Baseball CoachHelm	Staff Meeting Mode
Film becomes action - Link clips to pitches, swings, lifts, practices, and insights - Convert video to player tasks and practice stations	AI that actually coaches workflow - Chase, command, workload, readiness, class conflicts, practice impact - Cites sources and tracks actions/outcomes	Meetings become execution - Auto agenda from signals, imports, availability, video, and tasks - Every item converts into follow-up

Why it is better than the market

Teamworks handles broad operations. TeamBuildr handles lifts. GameChanger and StatCrew handle stats. TrackMan and Rapsodo measure player development. Synergy and 6-4-3 are strong for video and analytics. BaseballHelm does not naively replace all of them. It becomes the baseball-specific decision layer above them: ingest, organize, explain, assign, and measure.

Practice Planning That Actually Connects

Practice Plan Builder

Time slots on the left. Headline is required. Description, players, staff, signals, and metrics are optional but powerful.

2:45

Dynamic warmup + throwing ramp

Pitchers follow workload-specific throwing plan.

workload linked

3:00

Two-strike chase station

Group A sees breaking balls below zone; track swing/take decisions.

CoachHelm signal

3:20

Catcher block down/arm-side

Catchers rotate with machine; tag miss location and recovery.

3:45

Controlled scrimmage

Blue vs White; score as scrimmage; link to practice event.

lineup attached

Scrimmage Lineup

A circular diagram representing a baseball field. The positions are labeled: CF (Center Field) at the top, LF (Left Field) on the left, RF (Right Field) on the right, SS (Short Stop) in the middle-left, P (Pitcher) in the center, 2B (Second Base) in the middle-right, 3B (Third Base) in the bottom-left, 1B (First Base) in the bottom-right, and C (Catcher) at the bottom.

Batting Order

1. Reyes - SS
2. Miller - CF
3. Jackson - 1B
4. Ortiz - DH

Coaches build time slots, add a headline, attach optional descriptions, assign staff and players, then drag players into scrimmage positions. The plan attaches to the calendar event and flows into Player Today.

CoachHelm Measures Practice Effectiveness

Practice Effectiveness Loop

Measure whether what the team practices is actually improving game, scrimmage, and development metrics.

The coolest part is the feedback loop: BaseballHelm can compare what was practiced against what changed later in scrimmages and official games. CoachHelm has to be honest - improvement, no transfer yet, or insufficient sample - but even that honesty is a major upgrade over guessing.

Staff Cockpit + Player Simplicity

Staff get a dense command center. Players get a clean mobile Today screen. That split matters: coaches need context, players need action.

The Friend-Friendly Pitch

1	It automatically pulls official stats after games when set up with the SID/stat workflow.
2	It separates official games, scrimmages, practices, lifts, soreness, video, and classes instead of mixing everything into one messy table.
3	It lets coaches build practice plans with time slots and scrimmage lineups, then attaches the plan to the calendar.
4	It shows each player a clean snapshot: performance, video, lifts, bodyweight, soreness, class conflicts, tasks, and timeline.
5	CoachHelm analyzes what changed, suggests actions, and measures whether practice actually improved the related stats.

Bottom line: BaseballHelm is not just another baseball app. It is the operating layer that turns official stats, practice, lifting, video, classes, and AI into coordinated player development.
